

How to Transfer Your Podcast RSS Feed

*Transferring your podcast from one hosting provider to another can be completed in **six easy steps**.*

1

Create an account with your NEW podcast host provider.

All you really need is a username and password to access your new account. Don't worry about filling in the details.

2

Import content from your current podcast host provider.

Grab your current RSS feed and import it into your NEW podcast host provider. This takes all the content from your old feed and adds it to your new RSS feed through your new provider.

3

Check and make sure everything is transferred properly.

Look at the content imported into your new podcast host provider. Text imports easily, but make sure all your media files are there as well. If not, you may need to re-upload the files.

4

Redirect your old RSS feed to your new RSS feed.

Tell your old podcast host to redirect your old RSS feed to your new RSS feed. When complete, you should be able to click on your old feed and it should automatically redirect to your new feed.

5

Swap out old episode links and embed codes.

Any episode links or embed codes on your website from your old podcast host provider will need to be swapped out because they are directly connected to your old host provider.

6

Cancel account with previous podcast host provider.

Once all the links and embed codes are swapped out, cancel your account with your previous podcast host provider. Wait at least 30 days from the day you redirected your feed.
